

ATTENTION ALL LEAF LOVERS

Stuck on the germination phase?

Here is the Mosca Method of Seed Germination. We have used many methods of germination, and this is our preferred method.

We no longer endorse using the "Paper towel method." This is because this method caused too much damage to the emerging seed

MOSCA METHOD OF SEED GERMINATION

Fill a solo cup with 8oz of water and mix with 2oz of hydrogen peroxide (drugstore quality is fine)

Put seeds in your solo cup of 10oz liquid. Store in a dark place, like a cabinet, for 24-48 hours

Once your seeds have cracked and the tap root has emerged -it's time to transplant

After the tap root has emerged, then add your germinated seed to your soil. We prefer Coco
Happy gardening!
